

About Medipense Inc.

Medipense was founded in 2013 by caring, senior-approaching entrepreneurs who quickly realized the importance of medication adherence, compliance and self-sufficiency and what that meant to seniors, veterans, their caregivers and government agencies.

Medipense is the inventor and manufacturer of RxPense[®], an integrated, intelligent and connected medication therapy management and remote monitoring system designed for Seniors, Chronic Care Patients, Disabled Veterans, and those with complex medication regimens.

After 4 years of research and development, we have entered manufacturing and are ready for commercialization.

RxPense[®] Product Brief

RxPense[®] is a personal medication dispensing and remote monitoring solution that ensures seniors, disabled veterans or chronic care patients in residences, long-term care facilities or at home, take the correct medications on time and notifies caregivers or health care providers (HCP) if they miss a dose. It also accurately records and documents the consumption of both PRN “as-needed” and OTC medications. It can also capture (through external sensors), monitor and store vitals along with the electronic patient record. Medications are securely locked into the device (physical security) and can only be dispensed when the patient is authenticated at the right time (biometric, RFID or password).

RxPense[®] is the only device which secures, stores and automates the dispensing of pharmacist-filled and sealed, industry standard weekly multidose blister-packaged medications such as DisPill[™], Distrimedic[™], Eco-Pill[™] and others, through a patented process, and significantly reduces the risk of medication non-adherence. Patients can reliably take their meds, and remain connected to care, even at home.

The RxPense[®] system includes the RxPense[®] Hub, Cloud-based Portal and Mobile Applications working in synergy to better manage and communicate in a value-based care environment. The entire system is HIPAA and PIPEDA compliant.

The RxPense[®] records consumption as patients take their medications and makes this data available to health care providers and caregivers. The RxPense[®] does not diagnose, treat or otherwise advise patients about their medical conditions. Rather, the RxPense[®] serves as a reminder to patients and makes it easier for seniors to take their medications on time.
